

Water saving solutions from **Bio-Productions**

The truth about toilet smells, aggressive cleaning chemicals, washroom flooding, U bends and waterless systems. In a world dominated by convenience we are all looking for an easy solution well here it is!

bio
productions

To enable you to get the maximum water savings from urinals, without the hassle of physically cleaning and deodorising the pipe work and urinal trap regularly, Bio-Productions formulated the, "Bio Block".

This "toss-it-in-and-forget-it" urinal block combines both chemical cleaning agents with a safe, biological activity to remove the solids (including calcium and uric crystals) that cause blockages and washroom odours.

Simply by "tossing" a Bio Block into each urinal is sufficient to maintain clear odourless pipe work, as each time the urinal is used the client washes some of these chemical and biological cleaning agents into the system.

Additional financial benefits can be obtained by reducing the frequency of the flush, and typically around 100,000 litres of water can easily be saved by flushing between just three and five times every 24 hours.

Some systems claim to offer fully waterless but we at Bio-Productions would not advocate this as the solids in the urine settle-out and adhere to the pipes, causing blockages unless purged occasionally.

To counter this, waterless systems often suggest flushing with a cocktail of cleaning agents and water. However this usually provides insufficient liquid to purge these solids through the pipes so only the urinal trap is cleaned. Consequently the build-up in difficult to clear pipes goes unnoticed until flooding problems occur.

Bio Blocks contain only biodegradable materials

These include a **special fragrance**, which does not mask odours but creates a pleasant environment for the client.

Surfactant cleaning agents. These enable the specially selected bacteria to quickly make contact with the soiling and solids to be degraded.

High quantities of specially selected (and harmless) bacteria. These colonise the urinal pipes and degrade the body-solids, calcium and urine crystals, keeping the pipes clear and free from odours.

Using the blocks

Simply place (or toss) a Bio Block into each urinal. Or, place one every couple of feet in a slab (or trough) urinal.

Ideally reduce the frequency of flushing to once every 5 or 6 hours (it can be more often during the day and less frequently during the night-time if preferred).

Replace the blocks as and when they dissolve.

It is typical for some urinals to be used more frequently than others, so in these cases the blocks will dissolve more quickly. This caters for the high volume urinals and the less used urinals, delivering more biological cleaning activity where needed.

Complimentary washroom cleaning

As urine is often splashed onto adjacent surfaces, Bio-Productions has created a liquid cleaner, Blu-Away, to compliment Bio Blocks. Blu-Away contains the same chemical and biological activity as Bio Blocks and may be used safely to de-contaminate these surfaces.

Simply by spraying or swabbing a dilution of Blu-Away onto the contaminated surface once or twice each week, the whole washroom can easily be maintained as a clean, odour-free and hospitable environment for the client.

Blu-Away may also be used to clean and maintain washroom fittings including urinals, toilet-bowls, showers and hand-basins.

Like Bio Blocks, Blu-Away contains bacteria that degrade calcium, enabling it to be dissolved and removed by cold-water. This takes a couple of applications but unlike some aggressive chemical cleaners, it does not damage chrome and aluminium fittings.

Blu-Away may also be used for supplementing the Bio Block activity and just by cleaning the urinal once or twice each day will accomplish this.

No special preparation required

It is clear that by utilising the billions of safe bacteria within Bio Blocks and Blu-Away, washroom cleaning and water savings can be achieved.

There is no requirement to disconnect plumbing or administer a special cleaning solution to the urinals manually.

All that is required is to ensure no aggressive chemicals and disinfectants are used, which will prevent the biological activity.

Replace dissolved Bio Blocks whenever necessary.

Swab urine contaminated surfaces (walls and/or floors) once or twice each week with a solution of Blu-Away and you and your clients will enjoy water-savings - labour savings and a healthy washroom environment - *naturally!*

Using Bio-Productions Bio Blocks in ONE single urinal alone can save circa 100,000 litres of water a year. That's the equivalent to the TOTAL annual water usage of a small household... per single urinal!

 =  = 100,000 litres per annum

A pub or small office

Five urinals = 500,000 litres SAVED per year

A night club

Ten urinals = 1,000,000 litres SAVED per year

An average sized hotel

30 urinals = 3,000,000 litres SAVED per year

A sports arena

100 urinals = 10,000,000 litres SAVED per year

4 olympic sized swimming pools!

Huge potential £££ savings

- An average urinal is flushed 36 times a day.
- That's a colossal 13,140 flushes a year.
- Or, in money terms, around £170 of water flushed down the (urinal) drain every year.
- Using Bio Blocks, you can reduce this flush frequency to around 4 times a day.
- That's a staggering 11,452 less flushes per annum.
- Or, in money terms, under £20 of water flushed down the (urinal) drain every year.
- Or, better still, a massive saving of around £150 per year... per urinal.
- Not dissimilar to the annual water bill for a small house.
- And Bio Blocks cost just £20 per urinal per year.
- So, you can save around £150 per year... per urinal.
- That's a lot of money in anyone's book.
- And that's before you consider the very significant environmental contribution you are making...

Bio Blocks (not money) down your drains this year.

without Bio Blocks

with Bio Blocks

Bio Blocks do not contain pDCB or other dangerous chemicals and are particularly suitable for use in public buildings, schools, institutions, hotels, pubs, clubs and restaurants. The pictures above show two urinal outlets after six months use - one using Bio Blocks, the other no blocks at all.
